<u>Final Task</u>

I am building a webapp based on employee data. I will implement CRUD operations on employees and file CRUD as well. I will be using Mongo as database. There will be 4 models, Employee model will store all the organization based details of employee, personal model will store the all the personal details of employees, role model will store all the organization roles and a user model to store the users . All the users will be authenticated before viewing internal data and all the data will be validated before entering. I will use pdfdoc to create pdfs of details of individual employees and nodemailer to share the pdf as attachment to the user. Finally I will use logger to store all the logs in a file.
